In this new era of 'big data', the use of statistical software has become inevitable and choosing the right data analysis software is becoming an important aspect of research in virtually any field of human endeavour. Statistical packages are collections of software designed to aid in statistical analysis and data exploration. The vast majority of quantitative and statistical analysis relies upon statistical packages for its execution. An understanding of statistical packages is very essential. Statistical analysis can be implemented using programming languages like C++, Java, and FORTRAN e.t.c but statistical packages are time, effort and cost saving also providing a common interface for data manipulation, visualization and statistical analysis. However, statistical packages vary greatly with respect to accuracy and reliability and reported results may be dependent on the specific package and version. The aim of this paper therefore is to compare the features and output of regression analysis of five statistical packages: Microsoft Excel (2007), R package, SPSS, GraphPad and Stata. In this paper, regression analysis was used to determine the intercept and coefficients of a relation and the results obtained were tabulated. Therefore, for solution that requires high accuracy with speed, Stata is highly recommended.

Keywords: Data manipulation, visualization, Data exploration and statistical analysis

Statistics is the science of making effective use of numerical data relating to groups of individuals or experiments. It deals with all aspects of this, including not only the collection, analysis and interpretation of such data, but also the planning of the collection of data, in terms of the design of surveys and experiments. Traditional or manual method takes lot of time whereas statistical software makes the statistical analysis easier with better accurate result. Statistical software are specialized computer programs for analysis in statistics and econometrics. A wide range of software statistical packages can be used to analyse data. These ranges from Access or Excel to dedicated packages such as SPSS, Stata and R for **statistical** analysis of quantitative data, Nvivo for **qualitative** (textual and audio-visual) data analysis (QDA), or ArcGIS for analysing **geospatial** data.

Cavaliere (2015) observed that we live in “data era” where the use of statistical or data analysis software is inevitable in any research field. This means that the choice of the right software tool or platform is a strategic issue for a research department. Nevertheless, in many cases users of statistical software do not pay the right attention to a comprehensive and appropriate evaluation of what the intended use of the result of the data analysis is. Indeed, the choice still depends on few factors like, for instance, researcher’s personal inclination, e.g., which software is already known, which shouldn’t be the case. According to Godsey (2019), it’s often helpful if a statistical tool can perform some related methods. Often, you’ll find that the method you chose doesn’t quite work as well as you’d hoped, and what you learned in the process leads you to believe that a different method might work better. If your software tool doesn’t have any alternatives, then you’re either stuck with the first choice or you’ll have to switch to another tool.

2. METHODOLOGY AND DATA PRESENTATION

Table 1: Quick Sort Algorithm Implementation In C

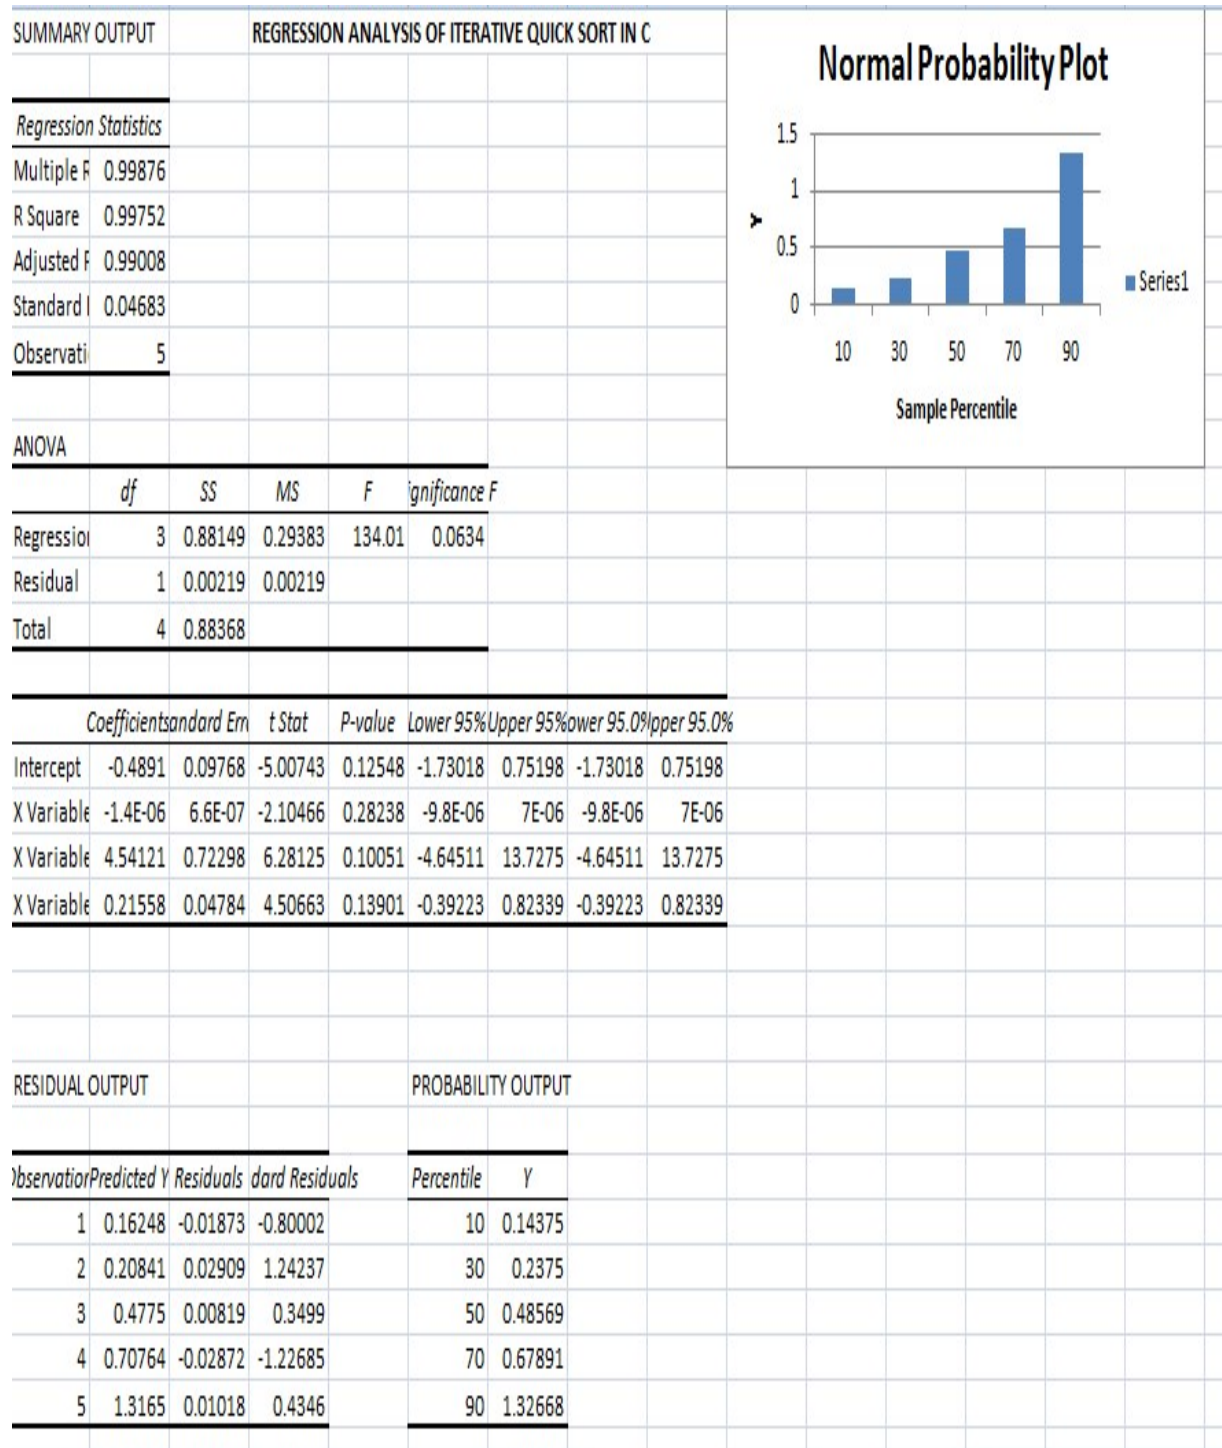

Data Size	Average Execution Time(Sec)	Power (Watt)	Energy (Joule)
100,000	0.0594	2.42	0.143748
200,000	0.125	1.9	0.2375
300,000	0.1372	3.54	0.485688
400,000	0.2652	2.56	0.678912
500,000	0.3902	3.4	1.32668

The following five Statistical packages are selected for comparison:

SPSS: SPSS stands for Statistical Package for the Social Sciences. It was one of the earliest statistical packages with Version 1 being released in 1968, well before the advent of desktop computers. It is now on Version 23.

USING R

The screenshot displays the RStudio environment. The script editor on the left contains the following R code:

```
1 D<-c(100000,200000,300000,400000,500000)
2 T<-c(0.0594,0.125,0.1372,0.2652,0.3902)
3 P<-c(2.42,1.9,3.54,2.56,3.4)
4 E<-c(0.143748,0.2375,0.485688,0.678912,1.32668)
5 lm(formula = E ~ D + T + P, data = cars)
6
```

The Environment pane on the right shows the following objects:

Object	Class	Value
D	num [1:5]	1e+05 2e+05
death	num [1:4]	2 3 4 6
DS	num [1:5]	100 200 300
E	num [1:5]	0.144 0.237
Eiqj	num [1:5]	0.389 0.718
Et	num [1:5]	0.056 0.065
malaria	num [1:4]	24 3 7 2
P	num [1:5]	2.42 1.9 3.54 2.56 3.4
T	num [1:5]	0.0594 0.125 0.1372 0.2652 0.3902

The Console pane at the bottom shows the execution of the code and the resulting linear model output:

```
> D<-c(100000,200000,300000,400000,500000)
> T<-c(0.0594,0.125,0.1372,0.2652,0.3902)
> P<-c(2.42,1.9,3.54,2.56,3.4)
> E<-c(0.143748,0.2375,0.485688,0.678912,1.32668)
> lm(formula = E ~ D + T + P, data = cars)

Call:
lm(formula = E ~ D + T + P, data = cars)

Coefficients:
(Intercept)          D          T          P
-4.891e-01 -1.399e-06  4.541e+00  2.156e-01
```

Multiple Regression Results

What equation fits the data the best?

$$[A:] = -0.4891 - 1.398E-06*[B:] + 4.541*[C:] + 0.2156*[D:]$$

Variable	Coefficient	SE	95% Confidence Interval
(constant)	-0.4891	0.09768	-1.730 to 0.7520
B:	-1.398E-06	6.646E-07	-9.843E-06 to 7.045E-06
C:	4.541	0.7230	-4.645 to 13.727
D:	0.2156	0.04784	-0.3922 to 0.8234

How good is the fit?

R squared = 99.75%.

This is the percent of the variance in A: explained by the model.

The P value is 0.0634, considered not quite significant.

The P value answers this question:

If there were no linear relationship among the variables, what is the chance that R squared would be that high (or higher) by chance?

Since P is high, the rest of the results will be of little interest.

Sum-of-squares	0.002193
SD of residuals	0.04683
R squared	0.9975
Adjusted R squared	0.9901
Multiple R	0.9988

4. DISCUSSION OF RESULTS

The output of regression analysis using SPSS is approximated irrespective of the number of decimal places specified during data analysis. The results generated by R package and GraphPad are the same. The result from Microsoft Excel is better than R package and GraphPad and has the advantage of user friendly environment. However, with Stata, the results have an extended approximate values, making its output to be reliable for solutions that requires high accuracy.
